

# *Mr.CAS* - A Pure *Ruby* Automatic Differentiation Library for Fast Prototyping of Interfaces

Matteo Ragni<sup>a</sup>

<sup>a</sup>*Department of Industrial Engineering, University of Trento, 9, Sommarive, Povo di  
Trento, Italy*

---

## Abstract

This work presents a new *Ruby* library for symbolic and automatic differentiation, that exposes minimalistic CAS capabilities — i.e. simplifications, substitutions, evaluations, etc. Library aims at rapid prototyping of numerical interfaces and code generation for different target languages, separating mathematical expression from exportation rules — e.g. models from numerical conditioning best practices.

The library is implemented in pure *Ruby* language and compatible with all *Ruby* interpreter flavours.

*Keywords:* CAS, code-generation, Ruby

---

## 1. Motivation and significance

*Ruby* [1] is a purely object-oriented scripting language designed in the mid-1990s by Yukihiro Matsumoto (also known as *Matz*), internationally standardized since 2012 as ISO/IEC 30170.

With the advent of the *Internet of Things*, a written from scratch version of the *Ruby* interpreter called *mRuby* (*eMbedded Ruby*) [2] has been published on *GitHub* by Matsumoto, in 2014. The new interpreter is a lightweight implementation, aimed at both low power devices and PC, and complies with

---

*Email address:* `matteo.ragni@unitn.it` (Matteo Ragni)

9 the standard[3]. *mRuby* has a completely new API, and it is designed to be  
10 embedded in complex projects as a front-end interface — e.g. a numerical  
11 optimization suite may use *mRuby* to get problem input definitions.

12 The *Ruby* code-base exposes a large set of utilities in core and standard  
13 library, that can be furthermore expanded through modules, contained in  
14 *gems*. Even if a high number of gems are deployed and available, there  
15 is no module that implements an **automatic symbolic differentiation**  
16 (ASD) [4] engine that handles basic computer algebra routines, compatible  
17 with all different *Ruby* interpreters flavours.

18 *Ruby* has matured its fame as a web oriented language with *Rails*, and  
19 can efficiently generate code in other languages. An ASD-capable gem is the  
20 fundamental step to rapidly develop specific code generators for well known  
21 software — e.g. IPOPT [5, 6].

22 *Mr.CAS*<sup>1</sup> is a gem implemented in pure *Ruby* code — compatible with all  
23 standardized interpreters — that is able to perform symbolic differentiation  
24 (SD) and some computer algebra operations [7]. The library aims at:

- 25 • be an instrument for rapid development of prototype interface for nu-  
26 merical algorithms and exporting code generated in different target  
27 languages;
- 28 • generate rapidly descriptions of mathematical models, with *easy to im-*  
29 *plement* conditioning rules for numerical issues, changing on request  
30 how the code is exported, and how expressions are formulated in the  
31 target language;
- 32 • *separate mathematical expressions from numerical conditioning and*  
33 *workarounds*;

---

<sup>1</sup>Minimalistic Ruby Computer Algebra System

- create a complete open-source CAS system for the standard *Ruby* language, as a long-term ambitious impact.

This is not the first gem that tries to implement a CAS. The available computer algebra library for *Ruby* are:

***Rucas*** [8], ***Symbolic*** [9] gems at early stage and with discontinued development status; they offer basic simplification routines. There is no differentiation method, but it is one of the milestones.

***Symengine*** [10] is a wrapper for the C++ library *symengine*. The backend library is very complete, but it is compatible only with the RVM *Ruby* interpreter and has several dependencies. At the moment, the *SciRuby* [11] project reports the gem as broken, and removed it from its codebase. From a direct test, when performing SD of an arbitrary function, the engine always returns `nil`.

In Section 2 *Mr.CAS*'s container and tree structure is explained in detail and applied to basic CAS tasks. In Section 3 two examples on how to use the library as code generator or as interface are described. In Section 4, the reasons behind the implementation and the long term desired impact are depicted.

## 2. Software description

### 2.1. Software Architecture

*Mr.CAS* is an object oriented ASD gem that supports some computer algebra routines such as *simplifications* and *substitutions*. When gem is required, it overloads methods of `Fixnum` and `Float` classes, making them compatible with fundamental symbolic classes.

Each symbolic expression (or operation) is the instance of an object, that inherits from a common virtual ancestor: `CAS::Op`. An operation encapsulates sub-operations recursively, building a linked tree, that is the mathematical equivalent of function composition:

$$(f \circ g) \tag{1}$$

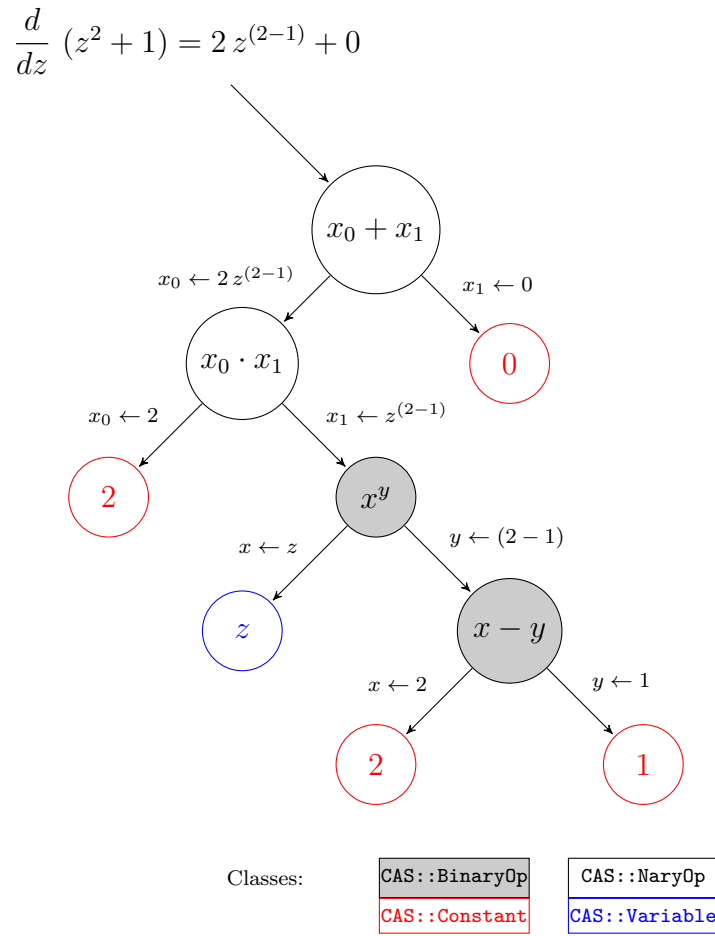

Figure 1: Tree of the expression derived in listing 1

When a new operation is created, it is appended to the tree. The number of branches are determined by the parent container class of the current symbolic function. There are three possible containers. Single argument op-

65 erations — e.g.  $\sin(\cdot)$  — have as closest parent the `CAS::Op` class, that links  
 66 to one sub-tree. Expressions with two arguments — e.g. difference or expo-  
 67 nential function — inherit from `CAS::BinaryOp`, that links to two sub-tree.  
 68 Operations with arbitrary number of arguments — e.g. sum and product  
 69 — have as parent the `CAS::NaryOp`<sup>2</sup>, that links to an arbitrary number of  
 70 sub-tree. Figure 1 contains a graphical representation. The different kind  
 71 of containers allows to introduce some properties — i.e. *associativity* and  
 72 *commutativity* for sums and multiplications [12]. Each container exposes the  
 73 sub-tree as instance properties. Containers interfaces and inheritances are  
 74 shown in Figure 2.

75 Terminal leafes of the graph are the classes `CAS::Constant`, `CAS::Va-`  
 76 `riable` and `CAS::Function`. The first models a simple numerical value,  
 77 while the second represents an independent variable, that can be used to  
 78 perform derivatives and evaluations, and the latter is a prototype of implicit  
 79 functions. As for now, those leafes exemplify only real scalar expressions,  
 80 with definition of complex, vectorial and matricial extensions as milestones  
 81 for the next major release.

82 SD (`CAS::Op#diff`) crosses the graph until it reaches ending nodes. A  
 83 terminal node is the starting point for derivatives accumulation, the mathe-  
 84 matical equivalent of the chain rule:

$$(f \circ g)' = (f' \circ g) g' \quad (2)$$

85 The recursiveness is used also for simplifications (`CAS::Op#simplify`), sub-  
 86 stitutions (`CAS::Op#subs`), evaluations (`CAS::Op#call`) and code genera-  
 87 tion.

---

<sup>2</sup>Please note that this container is still at experimental stage

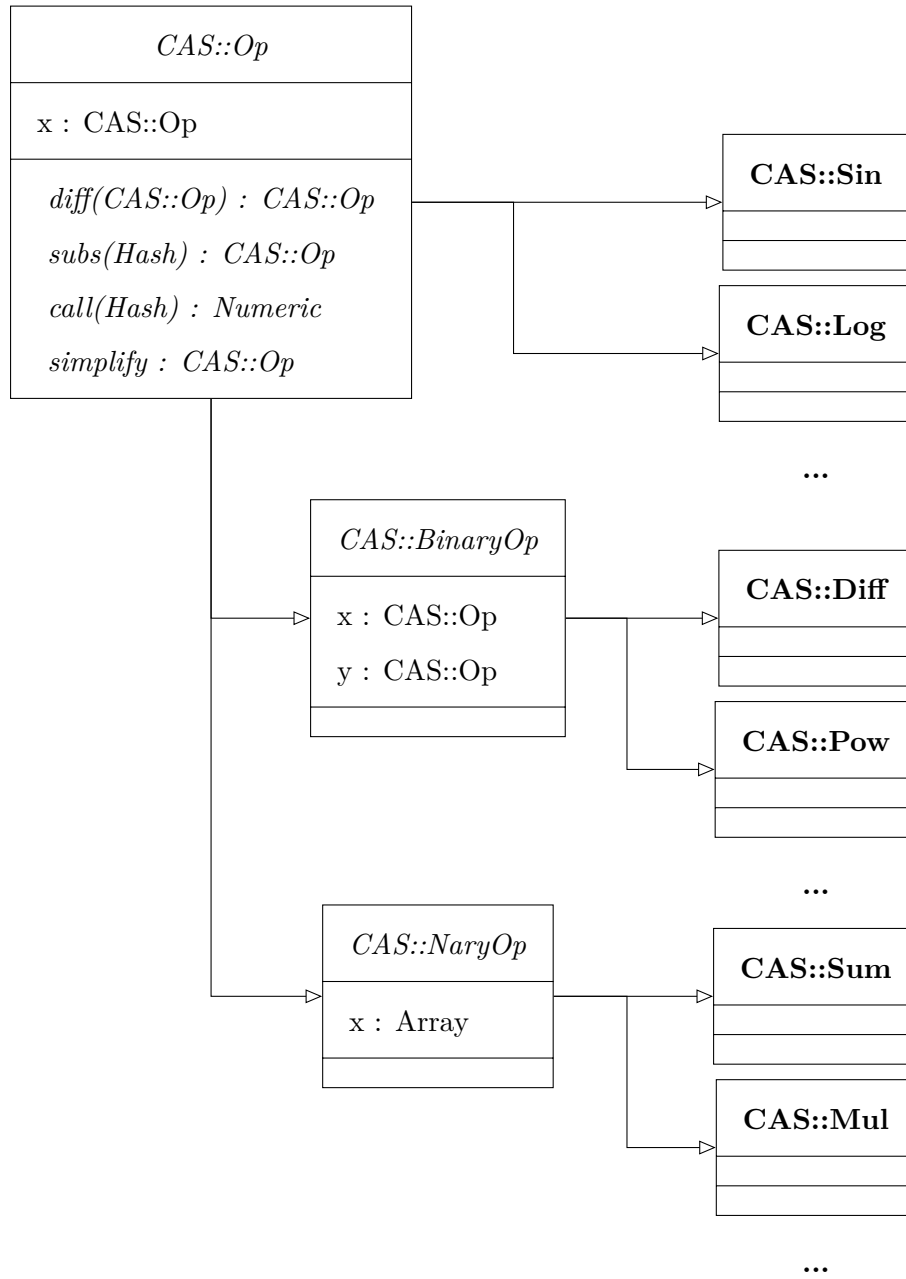

Figure 2: Simplified version of classes interface and inheritance

## 88 2.2. Software Functionalities

### 89 2.2.1. Software installation and prerequisites

90 *No additional dependencies are required.* The gem can be installed through  
91 *rubygems.org* provider<sup>3</sup>. Functionalities must be required runtime using the  
92 Kernel method: `require r.CAS`. All methods and classes are encapsulated  
93 in the module `CAS`.

### 94 2.2.2. Basic Functionalities

95 **SD** is performed with respect to independent variables (`CAS::Variable`  
96 `ble`) through forward accumulation, even for implicit functions. The dif-  
97 ferentiation is done by the method `CAS::Op#diff`, having a `CAS::Variable`  
98 `ble` as argument:

Listing 1: Differentiation example

```
99  
100 z = CAS.vars 'z'           # creates a variable  
101 f = z ** 2 + 1             # define a symbolic expression  
102 f.diff(z)                  # derivative w.r.t. z  
103 # => 2 * z ^ (2 - 1) + 0  
104 g = CAS.declare :g, f      # creates implicit expression  
105 g.diff(z)                  # derivative w.r.t. z  
106 # => (z ^ (2 - 1) * 2) * Dg[0](z ^ 2)  
107
```

108 **Automatic differentiation** (AD) is included as plugin and exploits dual  
109 numbers [13]. This differentiation strategy is useful in case of complex expres-  
110 sions, when explicit derivative's tree may exceed the call stack depth, that is  
111 platform dependent.

112 **Simplifications** are not executed automatically, after differentiations.  
113 Each node of the tree knows rules for simplify itself, and rules are called  
114 recursively, exactly like ASD. Simplifications that require an *heuristic expansion*  
115 of the subgraph — i.e. some trigonometric identities — are not defined

---

<sup>3</sup>gem install Mr.CAS

116 for now, but can be easily achieved through **substitutions**:

Listing 2: Simplification example

```
117
118 x, y = CAS::vars 'x', 'y'      # creates two variables
119 f = CAS.log( CAS.sin( y ) )    # symbolic expression
120 f.subs y: CAS.asin(CAS.exp(x)) # perform substitution
121 f.simplify                     # simplify expression
122
123 # => x
```

124 The tree is numerically **evaluated** when independent variables values are  
125 provided in a feed dictionary. The graph is reduced recursively to a single  
126 numeric value:

Listing 3: Tree evaluation example

```
127
128 x = CAS.vars 'x'                # creates a variable
129 f = x ** 2 + 1                  # define a symbolic expression
130 f.call x => 2                   # evaluate for x = 2
131
132 # => 5
```

133 Symbolic expressions can be used to create comparative expressions, that  
134 are stored in special container classes, modeled by the ancestor `CAS::Con-`  
135 `dition` — e.g.  $f(\cdot) \geq g(\cdot)$ . This allow the definition of piecewise functions  
136 — e.g.  $\max(f(\cdot), g(\cdot))$ .

Listing 4: Expressions and Piecewise functions

```
137
138 x, y = CAS.vars 'x', 'y'
139 f = CAS.declare :f, x
140 g = CAS.declare :g, x, y
141 f.greater_equal g
142 # => (f(x) >= g(x, y))
143 CAS::max f, g
144 # => ((f(x) >= g(x, y)) ? f(x) : g(x, y))
145
```

### 146 2.2.3. Metaprogramming and Code-Generation

147 *Mr.CAS* is developed explicitly for **metaprogramming** and **generation**  
148 **of code**. Expressions can be exported as source code or used as prototypes  
149 for callable *closures* (`Proc` objects):

Listing 5: Graph evaluation example

---

```

150
151 x = CAS::vars 'x'           # creates a variable
152 f = CAS::log(CAS::sin(x))   # define a symbolic function
153
154 proc = f.as_proc            # exports callable lambda
155 proc.call 'x' => Math::PI/2
156 # => 0.0
157

```

---

158     Compiling a closure of a tree is like making its snapshot, thus any fur-  
 159     ther manipulation of the expression do not update the callable object. This  
 160     drawback is balanced by the faster execution time of a **Proc**: when a graph  
 161     needs *only to be evaluated* in a iterative algorithm, transforming it in a *clo-*  
 162     *sure* reduces the execution time per iteration.

163     Code generation should be flexible enough to export expressions' trees  
 164     in a user's target language. Generation methods for common languages are  
 165     included in specific **plugins**. Users can furthermore expand exporting capa-  
 166     bilites by writing specific exportation rules, overriding method for existing  
 167     plugin, or desining their own exporter:

Listing 6: Example of Ruby code generation plugin

---

```

168
169 # Definition
170 module CAS
171   {
172     # . . .
173     CAS::Variable => Proc.new { "#{name}" }
174     CAS::Sin      => Proc.new { "Math.sin(#{x.to_ruby})" },
175     # . . .
176   }.each do |cls, prc|
177     cls.send(:define_method, :to_ruby, &prc)
178   end
179 end
180
181 # Usage
182 x = CAS.vars 'x'
183 (CAS.sin(x)).to_ruby
184 # => Math.sin(x)
185

```

---

### 186 3. Illustrative Examples

#### 187 3.1. Code Generation as C Library

188 In this example a model is exported as C library. `c-opt` plugin im-  
189 plements advanced features such as code optimization and generation of li-  
190 braries.

191 The library `example` implements the model:

$$f(x, y) = x^y + g(x) \log(\sin(x^y)) \quad (3)$$

192 Expression  $g(x)$  belongs to a external object, declared as `g_impl`, and its  
193 interface is described in `g_impl.h` header. The code is optimized: the inter-  
194 mediate operation  $x^y$  is evaluated once, even if appears twice in our model.  
195 The C function that implements our model  $f(x, y)$  is declared with the token  
196 `f_impl`. The exporter uses as default type `double` for variables and function  
197 returned values.

Listing 7: Calling optimized-C exporter for library generation

```
198
199 require 'ragini-cas/c-opt'
200
201 # Model
202 x, y = CAS.vars :x, :y
203 g = CAS.declare :g, x
204
205 f = x ** y + g * CAS.log(CAS.sin(x ** y))
206
207 # Code Generation
208 g.c_name = 'g_impl'          # g token
209
210 CAS::CLib.create "example" do
211   include_local "g_impl"      # g header
212   implements_as "f_impl", f   # token for f
213 end
214
```

215 Library created by `CLib` contains the following code:

Listing 8: C Header

```

// Header file for library: example.c

#ifndef example_H
#define example_H

// Standard Libraries
#include <math.h>

216 // Local Libraries
#include "g_impl"

// Definitions

// Functions
double f_impl(double x, double y);

#endif // example_H

```

Listing 9: C Source

```

// Source file for library: example.c

#include "example.h"

double f_impl(double x, double y) {
    double __t_0 = pow(x, y);
    double __t_1 = g_impl(x);
    double __t_2 = sin(__t_0);
    double __t_3 = log(__t_2);
    double __t_4 = (__t_1 + __t_3);
    double __t_5 = (__t_0 + __t_4);

    return __t_5;
}

// end of example.c

```

217 The function  $g(x)$  models the following operation:

$$g(x) = (\sqrt{x+a} - \sqrt{x}) + \sqrt{\pi+x} \quad (4)$$

218 and may suffer from *catastrophic cancellation* [14]. Users can specialize code  
 219 generation rules for this particular expression, conditioned through rational-  
 220 ization and instead of modifying the model  $g(x)$ , in listing 10, the rational-  
 221 ization is extended to all differences of square roots <sup>4</sup>. For more insight about  
 222 `__to_c` and `__to_c_impl` please refer to the software manual.

Listing 10: Conditioning in exporting function

```

223 # Model
224 a = CAS.declare "PARAM_A"
225
226 g = (CAS.sqrt(x + a) - CAS.sqrt(x)) + CAS.sqrt(CAS::Pi + x)
227
228
229 # Particular Code Generation for difference between square roots.
230 module CAS

```

---

<sup>4</sup>i.e.:  $\sqrt{\phi(\cdot)} - \sqrt{\psi(\cdot)} = \frac{\phi(\cdot) - \psi(\cdot)}{\sqrt{\phi(\cdot)} + \sqrt{\psi(\cdot)}}$

```

231     class Diff
232         alias :__to_c_impl_old :__to_c_impl
233
234         def __to_c_impl(v)
235             if @x.is_a? CAS::Sqrt and @y.is_a? CAS::Sqrt
236                 "({@x.x.__to_c(v)} + {@y.x.__to_c(v)}) / " +
237                 "( {@x.__to_c(v)} + {@y.__to_c(v)} )"
238             else
239                 self.__to_c_impl_old(v)
240             end
241         end
242     end
243 end
244
245 clib = CAS::Clib.create "g_impl" do
246     define "PARAM_A()", 1.0 # Arbitrary value for PARAM_A
247     define "M_PI", Math::Pi
248     implements_as "g_impl", g
249 end
250

```

---

251 It should be noted the **separation between the model** — that does  
 252 not contain conditioning — **and the code generation rule** — that over-  
 253 loads, for this particular case and this particular language, the predefined  
 254 code generation rule. Obviously, a user can decide to apply directly the  
 255 conditioning on the model. The result of listing 10 is reported:

Listing 11: g\_impl Header

```

// Header file for library: g_impl.c

#ifndef g_impl_H
#define g_impl_H

// Standard Libraries
#include <math.h>

// Local Libraries
256 // Definitions

#define PARAM_A() 1.0
#define M_PI 3.141592653589793

// Functions
double g_impl(double x);

#endif // g_impl_H

```

Listing 12: g\_impl Source

```

// Source file for library: g_impl.c

#include "g_impl.h"

double g_impl(double x) {
    double __t_0 = PARAM_A();
    double __t_1 = (x + __t_0);
    double __t_2 = sqrt(__t_1);
    double __t_3 = sqrt(x);
    double __t_4 = (__t_1 + x) / ( __t_2 +
        __t_3 );
    double __t_5 = (M_PI + x);
    double __t_6 = sqrt(__t_5);
    double __t_7 = (__t_4 + __t_6);

    return __t_7;
}

// end of g_impl.c

```

### 257 3.2. Using the module as interface

258 As example, an implementation of an algorithm that estimates the *order*  
259 *of convergence* for trapezoidal integration scheme [15] is provided, using the  
260 symbolic differentiation as interface.

261 Given a function  $f(x)$ , the trapezoidal rule for primitive estimation in the  
262 interval  $[a, b]$  is:

$$I_n(a, b) = h \left( \frac{f(a) + f(b)}{2} + \sum_{k=1}^{n-1} f(a + kh) \right) \quad (5)$$

263 with  $h = (b - a)/n$ , where  $n$  mediates the integration's step size. When exact  
264 primitive  $F(x)$  is known, approximation error is:

$$E[n] = F(b) - F(a) - I_n(a, b) \quad (6)$$

265 This error shows a direct relation:

$$E[n] \propto C n^{-p} \quad (7)$$

266 where  $p$  is the convergence order. Using a different value for  $n$ , for example

267  $2n$ :

$$\frac{E[n]}{E[2n]} \approx 2^p \quad \rightarrow \quad p \approx \log_2 \left( \frac{E[n]}{E[2n]} \right) \quad (8)$$

268 Following listings contain the implementation of the described procedure

269 using the described gem and the well known *Python* [16] library *SymPy* [17].

Listing 13: Ruby version

```

require 'ragni-cas'

def integrate(f, a, b, n)
  h = (b - a) / n

  func = f.as_proc

  sum = ((func.call 'x' => a) +
        (func.call 'x' => b)) / 2.0

  for i in (1...n)
    sum += (func.call 'x' => (a + i*h))
  end
  return sum * h
end

270 def order(f, a, b, n)
  x = CAS.vars 'x'

  f_ab = (f.call x => b) -
        (f.call x => a)
  df = f.diff(x).simplify
  f_1n = integrate(df, a, b, n)
  f_2n = integrate(df, a, b, 2 * n)

  return Math.log(
    (f_ab - f_1n) /
    (f_ab - f_2n),
    2)
end

x = CAS.vars 'x'
f = CAS.arctan x

puts(order f, -1.0, 1.0, 100)
# => 1.9999999974244451

```

271

Listing 14: Python version

```

import sympy
import math

def integrate(f, a, b, n):
  h = (b - a)/n
  x = sympy.symbols('x')
  func = sympy.lambdify((x), f)

  sums = (func(a) +
        func(b)) / 2.0

  for i in range(1, n):
    sums += func(a + i*h)

  return sums * h

def order(f, a, b, n):
  x = sympy.symbols('x')

  f_ab = sympy.Subs(f, (x), (b)).n() - \
        sympy.Subs(f, (x), (a)).n()
  df = f.diff(x)
  f_1n = integrate(df, a, b, n)
  f_2n = integrate(df, a, b, 2 * n)

  return math.log(
    (f_ab - f_1n) /
    (f_ab - f_2n),
    2)

x = sympy.symbols('x')
f = sympy.atan(x)

print(order(f, -1.0, 1.0, 100))
# => 1.9999999974244451

```

## 272 4. Impact

273 There are different complete CAS systems on the market, with complete  
274 solutions for analysis of analytical models. But exporting a model, for opti-  
275 mization or any other research activity, requires a lot of work, even with a  
276 good CAS software.

277 This library is a midpoint between a CAS and an AD library. It allows  
278 to manipulate expressions while maintaining the complete control on how  
279 the code is exported. Each rule is overloaded and applied runtime, without  
280 the need of compilation. Each user's model may include the mathematical  
281 description, code generation rules and high level logic that should be intrinsic  
282 to such a rule — e.g. exporting gradients as **patterns** instead of matrices.

283 Our research group is including **Mr.CAS** in a solver for optimal control  
284 problem with indirect methods, as interface for problems' description [18].

285 As a long term ambitious impact, this library will become a complete  
286 CAS for *Ruby* language, filling the empty space reported by *SciRuby* for  
287 symbolic math engines. This will require time, and the gem's MIT license  
288 allows everyone to contribute to the project.

## 289 5. Conclusions

290 This work presents a pure *Ruby* library that implements a minimalis-  
291 tics CAS with automatic and symbolic differentiation that is aimed at code  
292 generation and metaprogramming. Although at an early developing stage,  
293 *Mr.CAS* has promising feature, some of them shown in Section 3. Also, this  
294 is the only gem that implements symbolic manipulation for this language.

295 Language features and lack of dependencies simplify the use of the module  
296 as interface, extending model definition capabilities for numerical algorithms.  
297 All core functionalities and basic mathematics are defined, with the plan to

298 include more features in next releases. Reopening a class guarantees a *liquid*  
299 behaviour, in which users are free to modify core methods and their needs.

300 Library is published in *rubygems.org* repository and versioned on *github.com*,  
301 under MIT license. It can be included easily in projects and in inline inter-  
302 preter, or installed as a standalone gem.

### 350 **Current code version**

Nr.	Code metadata description	Please fill in this column
C1	Current code version	0.0.0
C2	Permanent link to code/repository used for this code version	<a href="https://github.com/MatteoRagni/cas-rb">github.com/MatteoRagni/cas-rb</a> & <a href="https://rubygems.org/gems/Mr.CAS">rubygems.org/gems/Mr.CAS</a>
C3	Legal Code License	MIT
C4	Code versioning system used	<i>git</i> (GitHub)
C5	Software code languages, tools, and services used	<i>Ruby</i>
C6	Compilation requirements, operating environments	<i>Ruby</i> $\geq 2.x$ , <i>pry</i> for testing console (optional)
C7	If available Link to developer documentation/manual	<a href="https://rubydoc.info/gems/Mr.CAS">rubydoc.info/gems/Mr.CAS</a>
C8	Support email for questions	<a href="mailto:info@ragni.me">info@ragni.me</a>

Table 1: Code metadata (mandatory)
