

Mr.CAS - A Minimalistic (pure) *Ruby* CAS for Fast Prototyping and Code Generation

Matteo Ragni^a

^a*Department of Industrial Engineering, University of Trento, 9, Sommarive, Povo di Trento, Italy*

Abstract

There are complete **Computer Algebra System** (CAS) systems on the market with complete solutions for analysis of analytical models. But exporting a model, for optimization or any other research activity, requires a lot of work, even with a good software.

This work presents a *Ruby* library that exposes minimalistic CAS capabilities — i.e. simplifications, substitutions, evaluations, etc. Library aims at rapid prototyping of numerical interfaces and code generation for different target languages, separating mathematical expression from exportation rules — e.g. models from numerical conditioning best practices.

The library is implemented in pure *Ruby* language and compatible with all *Ruby* interpreter flavours.

Keywords: CAS, code-generation, Ruby

¹ 1. Motivation and significance

² *Ruby* [1] is a purely object-oriented scripting language designed in the
³ mid-1990s by Yukihiro Matsumoto (also known as *Matz*), internationally
⁴ standardized since 2012 as ISO/IEC 30170.

Email address: `matteo.ragni@unitn.it` (Matteo Ragni)

5 With the advent of the *Internet of Things*, a written from scratch version
6 of the *Ruby* interpreter called *mRuby* (*eMbedded Ruby*) [2] has been published
7 on *GitHub* by Matsumoto, in 2014. The new interpreter is a lightweight
8 implementation, aimed at both low power devices and PC, and complies with
9 the standard[3]. *mRuby* has a completely new API, and it is designed to be
10 embedded in complex projects as a front-end interface — e.g. a numerical
11 optimization suite may use *mRuby* to get problem input definitions.

12 The *Ruby* code-base exposes a large set of utilities in core and standard
13 library, that can be furthermore expanded through modules, contained in
14 *gems*. Even if a high number of gems are deployed and available, there
15 is no module that implements an **automatic symbolic differentiation**
16 (ASD) [4] engine that handles basic computer algebra routines, compatible
17 with all different *Ruby* interpreters flavours.

18 *Ruby* has matured its fame as a web oriented language with *Rails*, and
19 can efficiently generate code in other languages. An ASD-capable gem is the
20 fundamental step to rapidly develop specific code generators for well known
21 software — e.g. IPOPT [5, 6].

22 *Mr.CAS*¹ is a gem implemented in pure *Ruby* code — compatible with all
23 standardized interpreters — that is able to perform symbolic differentiation
24 (SD) and some computer algebra operations [7]. The library aims at:

- 25 • be an instrument for rapid development of prototype interface for nu-
26 merical algorithms and exporting code generated in different target
27 languages;
- 28 • generate rapidly descriptions of mathematical models, with *easy to im-*
29 *plement* conditioning rules for numerical issues, changing on request

¹Minimalistic Ruby Computer Algebra System

30 how the code is exported, and how expressions are formulated in the
31 target language;

- 32 • *separate mathematical expressions from numerical conditioning and*
33 *workarounds*;
- 34 • create a complete open-source CAS system for the standard *Ruby* lan-
35 guage, as a long-term ambitious impact.

36 This is not the first gem that tries to implement a CAS. The available
37 computer algebra library for *Ruby* are:

38 ***Rucas*** [8], ***Symbolic*** [9] gems at early stage and with discontinued devel-
39 opment status; they offer basic simplification routines. There is no
40 differentiation method, but it is one of the milestones.

41 ***Symengine*** [10] is a wrapper for the C++ library *symengine*. The back-
42 end library is very complete, but it is compatible only with the RVM
43 *Ruby* interpreter and has several dependencies. At the moment, the
44 *SciRuby* [11] project reports the gem as broken, and removed it from
45 its codebase. From a direct test, when performing SD of an arbitrary
46 function, the engine always returns `nil`.

47 In Section 2 *Mr.CAS*'s container and tree structure is explained in detail
48 and applied to basic CAS tasks. In Section 3 two examples on how to use
49 the library as code generator or as interface are described. The reasons
50 behind the implementation and the long term desired impact are depicted in
51 Section 4. All Listings are available at http://bit.ly/Mr_CAS_examples.

52 2. Software description

53 2.1. Software Architecture

54 *Mr.CAS* is an object oriented ASD gem that supports some computer
55 algebra routines such as *simplifications* and *substitutions*. When gem is re-
56 quired, it overloads methods of **Fixnum** and **Float** classes, making them
57 compatible with fundamental symbolic classes.

58 Each symbolic expression (or operation) is the instance of an object, that
59 inherits from a common virtual ancestor: **CAS::Op**. An operation encapsu-
60 lates sub-operations recursively, building a linked tree, that is the mathemat-
61 ical equivalent of function composition:

$$(f \circ g) \tag{1}$$

62 When a new operation is created, it is appended to the tree. The num-
63 ber of branches are determined by the parent container class of the current
64 symbolic function. There are three possible containers:

65 **CAS::Op** single sub-tree operation — e.g. $\sin(\cdot)$.

66 **CAS::BinaryOp** dual sub-tree operation — e.g. exponent x^y — that inherits
67 from **CAS::Op**.

68 **CAS::NaryOp** operation with arbitrary number of sub-tree — e.g. sum $x_1 +$
69 $\dots + x_N$ — that inherits from **CAS::Op**.

70 Figure 1 contains a graphical representation. The different kind of contain-
71 ers allows to introduce some properties — i.e. *associativity* and *commutativ-*
72 *ity* for sums and multiplications [12]. Each container exposes the sub-tree
73 as instance properties. Containers interfaces and inheritances are shown in
74 Figure 2.

Figure 1: Tree of the expression derived in Listing 1

Terminal leafes of the graph are the classes `CAS::Constant`, `CAS::Variable` and `CAS::Function`. The first models a simple numerical value, while the second represents an independent variable, that can be used to perform derivatives and evaluations, and the latter is a prototype of implicit functions. As for now, those leafes exemplify only real scalar expressions, with definition of complex, vectorial and matricial extensions as milestones for the next major release.

SD (`CAS::Op#diff`) crosses the graph until it reaches ending nodes. A terminal node is the starting point for derivatives accumulation, the mathe-

84 matical equivalent of the chain rule:

$$(f \circ g)' = (f' \circ g) g' \quad (2)$$

85 The recursiveness is used also for simplifications (`CAS::Op#simplify`), sub-
 86 stitutions (`CAS::Op#subs`), evaluations (`CAS::Op#call`) and code genera-
 87 tion.

88 2.2. Software Functionalities

89 2.2.1. Software installation and prerequisites

90 *No additional dependencies are required.* The gem can be installed through
 91 *rubygems.org* provider². Functionalities must be required runtime using the
 92 Kernel method: `require r.CAS`. All methods and classes are encapsulated
 93 in the module `CAS`.

94 2.2.2. Basic Functionalities

95 **SD** is performed with respect to independent variables (`CAS::Variable`
 96 `ble`) through forward accumulation, even for implicit functions. The dif-
 97 ferentiation is done by the method `CAS::Op#diff`, having a `CAS::Variable`
 98 `ble` as argument:

Listing 1: Differentiation example

```

99
100 z = CAS.vars 'z'           # creates a variable
101 f = z ** 2 + 1             # define a symbolic expression
102 f.diff(z)                  # derivative w.r.t. z
103 # => (((z)^((2- 1)) * 2 * 1) + 0)
104 g = CAS.declare :g, f      # creates implicit expression
105 g.diff(z)                  # derivative w.r.t. z
106 # => (((z)^((2- 1)) * 2 * 1) + 0) * Dg[0](((z)^(2) + 1)))
107

```

²gem install Mr.CAS

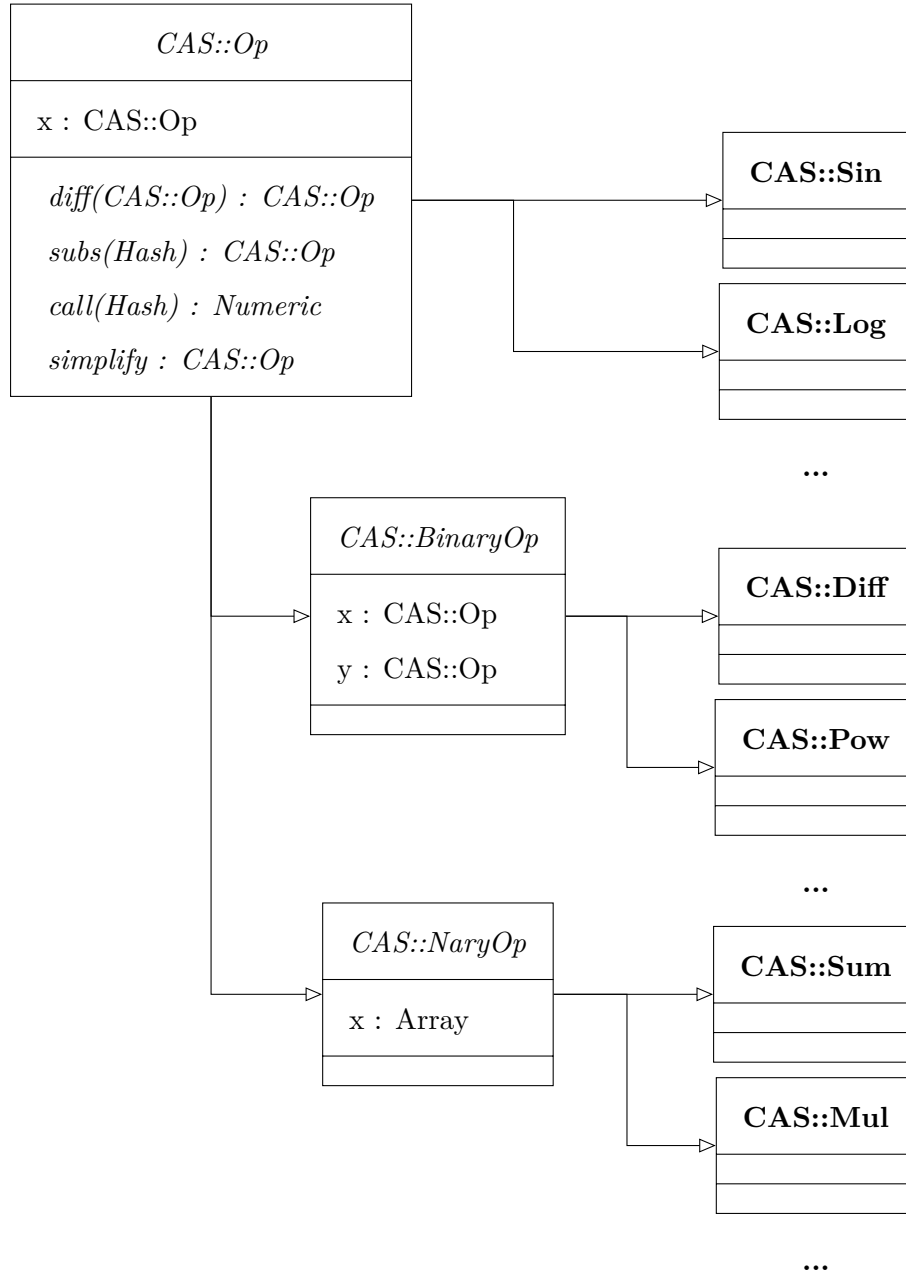

Figure 2: Simplified version of classes interface and inheritance

108 **Automatic differentiation** (AD) is included as plugin and exploits dual
 109 numbers [13]. This differentiation strategy is useful in case of complex expres-

sions, when explicit derivative's tree may exceed the call stack depth, that is platform dependent.

Simplifications are not executed automatically, after differentiations. Each node of the tree knows rules for simplify itself, and rules are called recursively, exactly like ASD. Simplifications that require an *heuristic expansion* of the subgraph — i.e. some trigonometric identities — are not defined for now, but can be easily achieved through **substitutions**:

Listing 2: Simplification example

```

117
118 x, y = CAS::vars 'x', 'y'      # creates two variables
119 f = CAS.log( CAS.sin( y ) )    # symbolic expression
120 f.subs y => CAS.asin(CAS.exp(x)) # performs substitution
121 f.simplify                     # simplifies expression
122 # => x
123

```

The tree is numerically **evaluated** when independent variables values are provided in a feed dictionary. The graph is reduced recursively to a single numeric value:

Listing 3: Tree evaluation example

```

127
128 x = CAS.vars 'x'      # creates a variable
129 f = x ** 2 + 1        # defines a symbolic expression
130 f.call x => 2          # evaluates for x = 2
131 # => 5.0
132

```

Symbolic expressions can be used to create comparative expressions, that are stored in special container classes, modeled by the ancestor `CAS::Condition` — e.g. $f(\cdot) \geq g(\cdot)$. This allow the definition of piecewise functions — e.g. $\max(f(\cdot), g(\cdot))$.

Listing 4: Expressions and Piecewise functions

```

137
138 x, y = CAS.vars 'x', 'y'
139 f = CAS.declare :f, x
140 g = CAS.declare :g, x, y
141 f.greater_equal g
142 # => (f(x) >= g(x, y))

```

```

143 CAS::max f, g
144 # => ((f(x) >= g(x, y)) ? f(x) : g(x, y))

```

146 2.2.3. Metaprogramming and Code-Generation

147 *Mr.CAS* is developed explicitly for **metaprogramming** and **generation**
148 **of code**. Expressions can be exported as source code or used as prototypes
149 for callable *closures* (**Proc** objects):

Listing 5: Graph evaluation example

```

150
151 x = CAS::vars 'x'           # creates a variable
152 f = CAS::log(CAS::sin(x))   # define a symbolic function
153
154 proc = f.as_proc           # exports callable lambda
155 proc.call 'x' => Math::PI/2
156 # => 0.0
157

```

158 Compiling a closure of a tree is like making its snapshot, thus any fur-
159 ther manipulation of the expression do not update the callable object. This
160 drawback is balanced by the faster execution time of a **Proc**: when a graph
161 needs *only to be evaluated* in a iterative algorithm, transforming it in a *clo-*
162 *sure* reduces the execution time per iteration.

163 Code generation should be flexible enough to export expressions' trees
164 in a user's target language. Generation methods for common languages are
165 included in specific **plugins**. Users can furthermore expand exporting capa-
166 bilites by writing specific exportation rules, overriding method for existing
167 plugin, or desining their own exporter:

Listing 6: Example of Ruby code generation plugin

```

168
169 # Rules definition for Fortran Language
170 module CAS
171   {
172     # . . .
173     CAS::Variable => Proc.new { "#{name}" }
174     CAS::Sin      => Proc.new { "sin(#{x.to_fortran})" },
175     # . . .

```

```

176     }.each do |cls, prc|
177         cls.send(:define_method, :to_fortran, &prc)
178     end
179 end
180
181 # Usage
182 x = CAS.vars 'x'
183 code = (CAS.sin(x)).to_fortran
184 # => sin(x)
185

```

186 3. Illustrative Examples

187 3.1. Code Generation as C Library

188 In this example a model is exported as C library. `c-opt` plugin implements
189 advanced features such as code optimization and generation of libraries.

190 The library `example` implements the model:

$$f(x, y) = x^y + g(x) \log(\sin(x^y)) \quad (3)$$

191 Expression $g(x)$ belongs to a external object, declared as `g_impl`, and its
192 interface is described in `g_impl.h` header. The code is optimized: the inter-
193 mediate operation x^y is evaluated once, even if appears twice in our model.
194 The C function that implements our model $f(x, y)$ is declared with the token
195 `f_impl`. The exporter uses as default type `double` for variables and function
196 returned values.

Listing 7: Calling optimized-C exporter for library generation

```

197
198 # Model
199 x, y = CAS.vars :x, :y
200 g = CAS.declare :g, x
201
202 f = x ** y + g * CAS.log(CAS.sin(x ** y))
203
204 # Code Generation
205 g.c_name = 'g_impl' # g token
206

```

```

207 CAS::CLib.create "example" do
208   include_local "g_impl"      # g header
209   implements_as "f_impl", f   # token for f
210 end
211

```

212 Library created by CLib contains the following code:

Listing 8: C Header

Listing 9: C Source

<pre> // Header file for library: example.c #ifndef example_H #define example_H // Standard Libraries #include <math.h> 213 // Local Libraries #include "g_impl" // Definitions // Functions double f_impl(double x, double y); #endif // example_H </pre>	<pre> // Source file for library: example.c #include "example.h" double f_impl(double x, double y) { double __t_0 = pow(x, y); double __t_1 = g_impl(x); double __t_2 = sin(__t_0); double __t_3 = log(__t_2); double __t_4 = (__t_1 + __t_3); double __t_5 = (__t_0 + __t_4); return __t_5; } // end of example.c </pre>
--	---

214 The function $g(x)$ models the following operation:

$$g(x) = (\sqrt{x+a} - \sqrt{x}) + \sqrt{\pi+x} \quad (4)$$

215 and may suffer from *catastrophic cancellation* [14]. Users can specialize code
 216 generation rules for this particular expression, conditioned through rational-
 217 ization and instead of modifying the model $g(x)$, in Listing 10, the rational-
 218 ization is extended to all differences of square roots³. For more insight about
 219 `__to_c` and `__to_c_impl` please refer to the software manual.

Listing 10: Conditioning in exporting function

220

³i.e.: $\sqrt{\phi(\cdot)} - \sqrt{\psi(\cdot)} = \frac{\phi(\cdot) - \psi(\cdot)}{\sqrt{\phi(\cdot)} + \sqrt{\psi(\cdot)}}$

```

221 # Model
222 a = CAS.declare "PARAM_A"
223
224 g = (CAS.sqrt(x + a) — CAS.sqrt(x)) + CAS.sqrt(CAS::Pi + x)
225
226 # Particular Code Generation for difference between square roots.
227 module CAS
228   class Diff
229     alias :__to_c_impl_old :__to_c_impl
230
231     def __to_c_impl(v)
232       if @x.is_a? CAS::Sqrt and @y.is_a? CAS::Sqrt
233         "({@x.x.__to_c(v)} + {@y.x.__to_c(v)}) / " +
234         "( {@x.__to_c(v)} + {@y.__to_c(v)} )"
235       else
236         self.__to_c_impl_old(v)
237       end
238     end
239   end
240 end
241
242 CAS::CLib.create "g_impl" do
243   define "PARAM_A()", 1.0 # Arbitrary value for PARAM_A
244   define "M_PI", Math::Pi
245   implements_as "g_impl", g
246 end
247

```

248 It should be noted the **separation between the model** — that does
 249 not contain conditioning — **and the code generation rule** — that over-
 250 loads, for this particular case and this particular language, the predefined
 251 code generation rule. Obviously, a user can decide to apply directly the
 252 conditioning on the model. The result of Listing 10 is reported:

Listing 11: g_impl Header

```

// Header file for library: g_impl.c

#ifndef g_impl_H
#define g_impl_H

// Standard Libraries
#include <math.h>

// Local Libraries
253

// Definitions
#define PARAM_A() 1.0
#define M_PI 3.141592653589793

// Functions
double g_impl(double x);

#endif // g_impl_H

```

Listing 12: g_impl Source

```

// Source file for library: g_impl.c

#include "g_impl.h"

double g_impl(double x) {
    double __t_0 = PARAM_A();
    double __t_1 = (x + __t_0);
    double __t_2 = sqrt(__t_1);
    double __t_3 = sqrt(x);
    double __t_4 = (__t_1 + x) / ( __t_2 +
        __t_3 );
    double __t_5 = (M_PI + x);
    double __t_6 = sqrt(__t_5);
    double __t_7 = (__t_4 + __t_6);

    return __t_7;
}

// end of g_impl.c

```

254 3.2. Using the module as interface

255 As example, an implementation of an algorithm that estimates the *order*
 256 *of convergence* for trapezoidal integration scheme [15] is provided, using the
 257 symbolic differentiation as interface.

258 Given a function $f(x)$, the trapezoidal rule for primitive estimation in the
 259 interval $[a, b]$ is:

$$I_n(a, b) = h \left(\frac{f(a) + f(b)}{2} + \sum_{k=1}^{n-1} f(a + kh) \right) \quad (5)$$

260 with $h = (b - a)/n$, where n mediates the integration's step size. When exact
 261 primitive $F(x)$ is known, approximation error is:

$$E[n] = F(b) - F(a) - I_n(a, b) \quad (6)$$

262 This error shows a direct relation:

$$E[n] \propto C n^{-p} \quad (7)$$

263 where p is the convergence order. Using a different value for n , for example

264 $2n$:

$$\frac{E[n]}{E[2n]} \approx 2^p \quad \rightarrow \quad p \approx \log_2 \left(\frac{E[n]}{E[2n]} \right) \quad (8)$$

265 Following Listings contain the implementation of the described procedure

266 using the described gem and the well known *Python* [16] library *SymPy* [17].

Listing 13: Ruby version

```

require 'Mr.CAS'

def integrate(f, a, b, n)
  h = (b - a) / n

  func = f.as_proc

  sum = ((func.call 'x' => a) +
        (func.call 'x' => b)) / 2.0

  for i in (1...n)
    sum += (func.call 'x' => (a + i*h))
  end
  return sum * h
end

267 def order(f, a, b, n)
  x = CAS.vars 'x'

  f_ab = (f.call x => b) -
        (f.call x => a)
  df = f.diff(x).simplify
  f_1n = integrate(df, a, b, n)
  f_2n = integrate(df, a, b, 2 * n)

  return Math.log(
    (f_ab - f_1n) /
    (f_ab - f_2n),
    2)
end

x = CAS.vars 'x'
f = CAS.arctan x

puts(order f, -1.0, 1.0, 100)
# => 1.9999999974244451

```

268

Listing 14: Python version

```

import sympy
import math

def integrate(f, a, b, n):
  h = (b - a)/n
  x = sympy.symbols('x')
  func = sympy.lambdify((x), f)

  sums = (func(a) +
          func(b)) / 2.0

  for i in range(1, n):
    sums += func(a + i*h)

  return sums * h

def order(f, a, b, n):
  x = sympy.symbols('x')

  f_ab = sympy.Subs(f, (x), (b)).n() - \
        sympy.Subs(f, (x), (a)).n()
  df = f.diff(x)
  f_1n = integrate(df, a, b, n)
  f_2n = integrate(df, a, b, 2 * n)

  return math.log(
    (f_ab - f_1n) /
    (f_ab - f_2n),
    2)

x = sympy.symbols('x')
f = sympy.atan(x)

print(order(f, -1.0, 1.0, 100))
# => 1.9999999974244451

```

269 4. Impact

270 *Mr.CAS* is a midpoint between a CAS and an ASD library. It allows
271 to manipulate expressions while maintaining the complete control on how
272 the code is exported. Each rule is overloaded and applied runtime, without
273 the need of compilation. Each user's model may include the mathematical
274 description, code generation rules and high level logic that should be intrinsic
275 to such a rule — e.g. exporting gradients as **patterns** instead of matrices.

276 Our research group is including **Mr.CAS** in a solver for optimal control
277 problem with indirect methods, as interface for problems' description [18].

278 As a long term ambitious impact, this library will become a complete
279 CAS for *Ruby* language, filling the empty space reported by *SciRuby* for
280 symbolic math engines. This will require time, and the gem's MIT license
281 allows everyone to contribute to the project.

282 5. Conclusions

283 This work presents a pure *Ruby* library that implements a minimalis-
284 tics CAS with automatic and symbolic differentiation that is aimed at code
285 generation and metaprogramming. Although at an early developing stage,
286 *Mr.CAS* has promising feature, some of them shown in Section 3. Also, this
287 is the only gem that implements symbolic manipulation for this language.

288 Language features and lack of dependencies simplify the use of the module
289 as interface, extending model definition capabilities for numerical algorithms.
290 All core functionalities and basic mathematics are defined, with the plan to
291 include more features in next releases. Reopening a class guarantees a *liquid*
292 behaviour, in which users are free to modify core methods and their needs.

293 Library is published in *rubygems.org* repository and versioned on *github.com*,

294 under MIT license. It can be included easily in projects and in inline inter-
295 preter, or installed as a standalone gem.

343 **Current code version**

Nr.	Code metadata description	Please fill in this column
C1	Current code version	0.0.0
C2	Permanent link to code/repository used for this code version	github.com/MatteoRagni/cas-rb & rubygems.org/gems/Mr.CAS
C3	Legal Code License	MIT
C4	Code versioning system used	<i>git</i> (GitHub)
C5	Software code languages, tools, and services used	<i>Ruby</i> language
C6	Compilation requirements, operating environments	<i>Ruby</i> $\geq 2.x$
C7	If available Link to developer documentation/manual	rubydoc.info/gems/Mr.CAS
C8	Support email for questions	info@ragni.me

Table 1: Code metadata (mandatory)
